

# Sharing Demo Code on CodeSandbox

- Organize your project: Structure your code so it's easy to understand and modify. Use a modular approach with separate files for models, routes, and services.
- Document your code: Add comments and docstrings explaining each function, class, and endpoint.
- Using CodeSandbox:
  - Create a new sandbox for your FastAPI project in CodeSandbox.
  - Add your backend files in the server directory.
  - Run and test the API directly from CodeSandbox using the integrated terminal.

# The Pitch

- Prepare a clear pitch that explains your app concept, how the backend powers it, and why it's useful.
- Showcase your API design and explain how it solves real-world problems.
- Share your demo code on CodeSandbox and highlight key sections (important routes, models, and security features).
- Engage the audience by explaining potential use cases and scalability.
