Python Brews

Welcome to the first step in building a real, functioning coffee shop ordering system in Python. Over the next few meetings, you and your group will design, code, and refine the core parts of an ordering app that will eventually become a full Tkinter GUI project.

What Our Final Project Will Be

This semester, our club will work toward creating a complete Coffee Shop Ordering System. The final version will use Tkinter to display a user interface that includes a drink selection menu, customization options, a shopping cart, and a checkout window. Every meeting will build one layer of this system. Today we begin by creating the logical foundation: prices, menu choices, and simple order handling.
